

Problem Set 4

Tristan Winkle

1 Questions and Responses

1. What data sources might you scrape?

- Developing web scraping skills has unlocked many new data opportunities for my research interests. A risk-free application involves scraping **ReliefWeb** to collect granular disaster declarations in developing countries. As a second option, I intend to attempt to scrape **ClearanceJobs** to construct a dataset that captures human capital dynamics within mercenary labor markets.

5(d). What type of an object is `mydf$date`?

- Character

6.7. Verify that the two dataframe are different types: `type(class(df1))` and `class(df)`. What is the class of each?

- Gemini Pro 3.1 (since OSCER would not run `sparklyr` package): The class of `df1` is a local R dataframe ("`tbl_df`"). The class of `df` is a "`tbl_spark`".

6.8. Are the column names any different across the two objects? If so, why might that be?

- They should be different. The iris df separates column names with "." and Spark translates them to "-".
